Zent2U announces the completion of development on Perindopril Arginine tablets

Zent2U is happy to announce successful completion of the development on ACE inhibitor **Perindopril Arginine**. Following positive results of pivotal bioequivalence study performed at Canadian CRO with Coversum Arginine® reference product by Servier® and complying stability data generated on registration batches of the product, we compiled EU CTD dossier which is available for review now.

Having all studies completed and our dossier compiled we're targeting to file registration at the earliest possible slot. We believe that having a dossier in place now grants Zent2U and its partners the great position to register in all relevant European markets at the earliest possible time, and therefore launch the product as soon as exclusivity expires.

Partner up now and connect with our team today!
